P O BOX 980				
VALLEY FORGE, PA 19482-0980			ART UNIT	PAPER NUMBER
			1644	

DATE MAILED: 10/04/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	Application No.	Applicant(s)
	10/645,913	GRUNSTEIN ET AL.
	Examiner Michael Szperka	Art Unit 1644

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

1) Responsive to communication(s) filed on \_\_\_\_.  
 2a) This action is FINAL.                            2b) This action is non-final.  
 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

4) Claim(s) 1-43 is/are pending in the application.  
 4a) Of the above claim(s) 10,23 and 27-43 is/are withdrawn from consideration.  
 5) Claim(s) \_\_\_\_ is/are allowed.  
 6) Claim(s) 1-9,11-22 and 24-26 is/are rejected.  
 7) Claim(s) \_\_\_\_ is/are objected to.  
 8) Claim(s) \_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

9) The specification is objected to by the Examiner.  
 10) The drawing(s) filed on \_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
 a) All    b) Some \* c) None of:  
 1. Certified copies of the priority documents have been received.  
 2. Certified copies of the priority documents have been received in Application No. \_\_\_\_.  
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### DETAILED ACTION

1. Applicant's response received July 17, 2006 is acknowledged.

Claims 1-43 are pending in the instant application.

Applicant's election with traverse of Group I, claims 3-13, 16-26, 38-43 and linking claims 1, 2, 14, and 15, as they read on methods of preventing asthma by administering proteins, polypeptides or antibodies that inhibit the binding of IgE to Fc $\epsilon$ RII, and the species election of parenteral (intravenous and intramuscular) in the reply filed on July 17, 2006 is acknowledged. The traversal is on the grounds that no burden exists in searching Groups I-III because they all belong to the same class. This is not found persuasive because classification is not the only basis for distinctness as was discussed in the restriction requirement mailed April 17, 2006, and because the inventions are classified into different subclasses.

Applicant repeats the same class argument concerning the restriction between Groups VI, VII, and VIII, between IX, X, and XI, and between XII, XIII, and XIV.

This argument is also not convincing for the reasons set forth in the restriction requirement mailed April 17, 2006 as well as those discussed above.

Applicant also argues that Groups IV and V are not distinct as product and process because the claims recite that the product is made by a recited method.

This argument is not convincing because product by process claims are not limited to the manipulations of the recited steps, only the structure implied by the steps, see MPEP 2113.

Applicant argues that Groups IV, V, VI, VII, and VIII are not distinct because claims 27-30 all recite an agent that prevents binding of IgE to Fc $\epsilon$ RII.

This argument is not convincing because claims 27-30 recite products and methods that differ in their process steps and goals as was stated in the restriction requirement mailed April 17, 2006.

Applicant argues that Groups I-III and XII-XIV are not distinct because they are all classified in the same class.

This argument is not convincing because other indicators of distinctness were set forth in the restriction requirement mailed April 17, 2006, and because the inventions are classified into separate subclasses.

Applicant's arguments concerning the species election are not convincing since while applicant argues that a skilled artisan would be able to identify various modes of administration, applicant does not state that the disclosure of any one mode of administration would render all other modes obvious to a skilled artisan, and as such the species election is maintained.

The requirement is still deemed proper and is therefore made FINAL.

Claims 27-37 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to nonelected inventions, while claims 10, 23, and 38-43 are withdrawn as being drawn to nonelected species. Applicant timely traversed the restriction and election requirement in the reply filed on July 17, 2006.

Claims 1-9, 11-22 and 24-26 are under examination as they read on methods of preventing induction of an asthmatic state by administering a protein, polypeptide or antibody that inhibits binding of IgE to Fc $\epsilon$ RII.

***Information Disclosure Statement***

2. Applicant's IDS received 8/30/04 is acknowledged and has been considered.
  
3. The Declarations of inventors Michael M. Grunstein and Hakon Harkonarson, as well as arguments received May 24, 2004 are acknowledged. These declarations and arguments pertain to rejections under 35 USC 103 that were made in parent application 09/261,104, and address the art of WO 97/04807, US 6,019,968, US 5,676,930, and WO 96/12741, and claim limitations such as "present on airway smooth muscle cells". No rejection employing the above cited references has been set forth in this application,

and the limitation "present on airway smooth muscle cells" is not recited in claims under examination. As such, the declaration does not appear to be pertinent and will not be addressed further.

***Claim Rejections - 35 USC § 112***

4. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

5. Claims 1-9, 11-22, and 24-26 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claims contain subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

The disclosure of the instant specification is not sufficient to enable a skilled artisan to practice the claimed invention without conducting an undue amount of experimentation. Undue experimentation must be considered in light of factors including: the breadth of the claims, the nature of the invention, the state of the prior art, the level of one of ordinary skill in the art, the level of predictability of the art, the amount of direction provided by the inventor, the existence of working examples, and the quantity of experimentation needed to make or use the invention, see *In re Wands*, 858 F.2d at 737, 8 USPQ2d at 1404 (Fed. Cir. 1988).

Regarding in vivo methods which rely on previously undescribed and generally unpredictable mechanisms, "The amount of guidance or direction needed to enable the invention is inversely related to the amount of knowledge in the state of the art as well as the predictability in the art." *In re Fisher*, 427 F.2d 833, 839, 166 USPQ 18, 24 (CCPA 1970). The "amount of guidance or direction" refers to that information in the application, as originally filed, that teaches exactly how to make or use the invention. The more that is known in the prior art about the nature of the invention, how to make, and how to use the invention, and the more predictable the art is, the less information

needs to be explicitly stated in the specification. In contrast, if little is known in the prior art about the nature of the invention and the art is unpredictable, the specification would need more detail as to how to make and use the invention in order to be enabling (MPEP 2164.03)." The MPEP also states that physiological activity can be considered inherently unpredictable.

Further, in *Rasmussen v. SmithKline Beecham Corp.*, 75 USPQ2d 1297-1303 (CAFC 2005), the court states "[W]here there is "no indication that one skilled in [the] art would accept without question statements [as to the effects of the claimed drug products] and no evidence has been presented to demonstrate that the claimed products do have those effects," an applicant has failed to demonstrate sufficient utility and therefore cannot establish enablement" and "If mere plausibility were the test for enablement under section 112, applicants could obtain patent rights to "inventions" consisting of little more than respectable guesses as to the likelihood of their success. When one of the guesses later proved true, the "inventor" would be rewarded the spoils instead of the party who demonstrated that the method actually worked. That scenario is not consistent with the statutory requirement that the inventor enable an invention rather than merely proposing an unproved hypothesis."

With these teachings in mind, an enabling disclosure, commensurate in scope with the breadth of the claimed invention, is required.

Applicant has recited methods of "preventing induction of the asthmatic state". The broadest reasonable interpretation of this phrase is that applicant's method is 100% effective in 100% of patients. The specification does not provide evidence that the claimed method is 100% effective. In fact, no working examples or in vivo data are disclosed, although in vitro data concerning cell lines and tissue sections are provided. A phase I (safety) clinical trial has been conducted wherein an anti-Fc $\epsilon$ RII (CD23) antibody was administered to human patients, but this study did not measure any of the signs and symptoms by which a determination could be made if the treatment had any clinical efficacy, such questions being deferred to phase II trials (Rosenwasser et al. *J. Allergy Clin Immunol* 2003, 112:563-570). Given that in vivo administration of anti-CD23 antibodies in nonhumans has been shown to decrease but not eliminate IgE

(Flores-Romo et al., Science, 1993, 261:1038-1041), and since IgE is known to play a causative role in asthma (Hahn, US Patent 4,579,840, see particularly section V starting in column 12), it does not appear reasonable that applicant's claimed method can achieve 100% efficacy in all patients.

Further, the "prevention of an asthmatic state" is accomplished by administering an "agent" which inhibits binding of IgE to Fc $\epsilon$ RII. The specification teaches that it is preferable to perform the recited methods using an antibody that binds to Fc $\epsilon$ RII, but that the invention also comprises administering any ligand of Fc $\epsilon$ RII including those ligands that are unknown. However, the breadth of the claims are even broader than administering any agent which is a ligand of Fc $\epsilon$ RII. Specifically, an agent that inhibits binding of IgE to Fc $\epsilon$ RII as is currently recited could be an anti-Fc $\epsilon$ RII antibody, or it could be an agent that does not bind Fc $\epsilon$ RII at all, since the binding specificity of the "agent" is not recited excepting dependent claims 6 and 19. For example, this broad genus of agents comprises antibodies which bind to IgE and prevent the binding of IgE to Fc $\epsilon$ RII, inhibitors of the expression of IgE and Fc $\epsilon$ RII such as antisense or RNAi molecules, and Fc $\epsilon$ RI, the high affinity receptor for IgE that is found on basophils and mast cells and competes for binding to IgE, and presumably encompasses unknown agents which inhibit the binding of IgE to Fc $\epsilon$ RII through unknown mechanisms.

Guidance or working examples concerning administering "agents" which inhibit the binding of IgE to Fc $\epsilon$ RII through undisclosed mechanisms do not appear to be present except for teachings concerning the administration of antibodies which bind Fc $\epsilon$ RII and thereby inhibit the binding of IgE to Fc $\epsilon$ RII. While the specification states that the invention encompasses ligands of Fc $\epsilon$ RII that are unknown, the specification cannot teach how to make such agents because by definition their composition or structure is not known. It logically follows if a substance is not known, the uses of that substance also cannot be known. Further, the claims are not limited to ligands that bind Fc $\epsilon$ RII. The specification does not appear to teach a generic mechanism concerning how "agents" inhibit the binding of IgE to Fc $\epsilon$ RII, nor does it appear to teach a screening mechanism that identifies the starting materials, process steps, and guidance as to the

what molecules will be obtained upon completion of the screen for "agents" which inhibit IgE binding to Fc $\epsilon$ RII. As such, a skilled artisan would need to engage in unpredictable trial and error to generically identify "agents" that inhibit the binding of IgE to Fc $\epsilon$ RII for use in the instant methods.

Thus, in view of the quantity of experimentation necessary, the lack of sufficient guidance in the specification, the lack of working examples, the unpredictability of the art, and the breadth of the claims, a skilled artisan would be required to perform undue trials and errors to practice the claimed invention.

6. Claims 1-5, 7-9, 11-18, 20-22, and 24-26 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claims contain subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventors, at the time the application was filed, had possession of the claimed invention.

Applicant has claimed methods which recite the use of agents which inhibit the binding of IgE to an Fc $\epsilon$ RII receptor protein. This broad genus encompasses anti-Fc $\epsilon$ RII antibodies, and also encompasses *anything* that inhibits the interaction between IgE and Fc $\epsilon$ RII. Note that binding of the agent to Fc $\epsilon$ RII is not recited as the physical mechanism by which this inhibition is accomplished. As such, the claims read on agents such as antibodies which bind to IgE and prevent the binding of IgE to Fc $\epsilon$ RII, inhibitors of the expression of IgE and Fc $\epsilon$ RII such as antisense or RNAi molecules, and Fc $\epsilon$ RI, the high affinity receptor for IgE that is found on basophils and mast cells and competes for binding to IgE. To support this broad genus of agents, applicant has disclosed just a single agent, namely anti-Fc $\epsilon$ RII receptor protein antibodies.

The guidelines for the Examination of Patent Applications Under the 35 U.S.C. 112, § 1 "Written Description" Requirement make clear that if a claimed genus does not show actual reduction to practice for a representative number of species, then the Requirement may be alternatively met by reduction to drawings, or by disclosure of relevant, identifying characteristics, i.e., structure or other physical and or chemical

properties, by functional characteristics coupled with a known or disclosed correlation between function and structure, or by a combination of such identifying characteristics, sufficient to show the applicant was in possession of the genus (Federal Register, Vol. 66, No. 4, pages 1099-1111, January 5, 2001, see especially page 1106 column 3).

As discussed above, there are many structurally distinct "agents" which can inhibit the binding of IgE to Fc $\epsilon$ RII by unrelated mechanisms. The mechanistic pathways by which these agents inhibit binding are distinct functional properties of the agents even though all agents share the common result of inhibiting the interaction of IgE and Fc $\epsilon$ RII. Therefore, there does not appear to be a common structure or a common functional mechanistic pathway that is present in the genus of all agents that share the result of inhibiting the binding of IgE to Fc $\epsilon$ RII.

In *The Regents of the University of California v. Eli Lilly* (43 USPQ2d 1398-1412) 19 F. 3d 1559, the court held that disclosure of a single member of a genus (rat insulin) did not provide adequate written support for the claimed genus (all mammalian insulins) and noted:

"A definition by function, as we have previously indicated, does not suffice to define the genus because it is only an indication of what the gene (in the instant case, an agent) does, rather than what it is. See Fiers, 984 F.2d at 1169-71, 25 USPQ2d at 1605-06 (discussing Amgen). It is only a definition of a useful result rather than a definition of what achieves that result. Many such genes (agents) may achieve that result. The description requirement of the patent statute requires a description of an invention, not an indication of a result that one might achieve if one made that invention. See *In re Wilder*, 736 F.2d 1516, 1521, 222 USPQ 369, 372-73 (Fed. Cir. 1984) (affirming rejection because the specification does "little more than outline [e] goals appellants hope the claimed invention achieves and the problems the invention will hopefully ameliorate."). Accordingly, naming a type of material generally known to exist, in the absence of knowledge as to what that material consists of, is not a description of that material."

The court has also noted that "Adequate written description requires a precise definition, such as by structure, formula, chemical name or physical properties, not a mere wish or plan for obtaining the claimed chemical invention." Id. at 1566, 43

Art Unit: 1644

USPQ2d at 1404 (quoting Fiers, 984 F.2d at 1171, 25 USPQ2d at 1606). Also see Enzo-Biochem v. Gen-Probe 01-1230 (CAFC 2002).

Therefore, it does not appear that the specification provides adequate written description for the genus of "agents" recited in the instant method claims, and as such applicant was not in possession of said genus at the time the application was filed.

Further, this application is a continuation of application 09/261,104, and the limitation "agents that inhibit IgE binding of IgE to an Fc $\epsilon$ RII receptor protein" is not an original claim limitation of the '104 application.

The specification teaches that:

"The invention relates to a method of preventing induction of an asthmatic state in a human patient comprising administering to the human *an anti-Fc. epsilon.RII receptor protein ligand* suspended in a pharmaceutically acceptable carrier in an amount sufficient to inhibit binding of IgE to an anti-Fc. epsilon.RII receptor protein thereby preventing induction of the asthmatic state in the human. Preferably, the pharmaceutically acceptable carrier is physiological saline." (see lines 20-26 of page 13).

"The invention should be construed to include any ligand that is currently either known or is heretofore unknown, which when bound to an Fc. epsilon.RII receptor protein on an airway smooth muscle cell of a mammal serves to alleviate an asthmatic state in the mammal.

By the term "ligand" as used herein, is meant any natural or synthetic composition or compound which is capable of specifically binding to its cognate receptor protein, and when so bound, prevents binding of IgE to the cognate receptor protein, such that an asthmatic state is prevented or diminished. By way of example, an antibody which specifically binds to an Fc. epsilon.RII receptor protein on an airway smooth muscle cell and inhibits binding of IgE thereto, is termed an "anti-Fc. epsilon.RII receptor protein ligand." In this context, the Fc: epsilon.RII receptor protein is the "cognate receptor protein" for the ligand.

By the term "anti-Fc. epsilon.RII receptor protein ligand" as used herein, is meant any natural or synthetic composition or compound which is capable of binding to an Fc. epsilon.RII receptor protein on an airway smooth muscle cell, which binding prevents binding of IgE to the cognate Fc. epsilon.RII receptor protein." (see lines 14-31 of page 14).

"The *ligand* for use in the method of the invention may be any natural or synthetic composition or compound which *when bound to its cognate receptor protein, effects the inhibition of binding of IgE to the cognate receptor protein*.

Thus, the ligand may be a protein, a peptide or a small molecule. The ligand may be administered to a cell as is, that is, as an isolated protein, an isolated peptide, a small molecule, or it may be administered to the cell in the form of an isolated nucleic acid sequence encoding the ligand." (see line 27 of page 15 to line 2 of page 16).

Based on the above, the specification does not teach "agents" but it does teach "ligands". Note that "ligands" are defined as binding to a cognate receptor, and the only cognate receptor that is discussed in the specification or is recited in the instant claims is Fc $\epsilon$ RII. As such, the disclosure as a whole teaches that the compounds administered in applicant's disclosed methods of treating asthma bind to the cognate receptor protein Fc $\epsilon$ RII.

The instant claims recite administering an "agent" that "inhibits binding of IgE to a Fc $\epsilon$ RII receptor protein". The specification does not appear to define "agent" as being equivalent to "ligand". An "agent" can inhibit the binding of IgE to Fc $\epsilon$ RII even if it does not bind Fc $\epsilon$ RII. The specification does not appear to teach methods wherein any compound that does not act as a ligand for the cognate receptor Fc $\epsilon$ RII can be administered to treat patients. Thus the removal of Fc $\epsilon$ RII binding specificity from the claimed method appears to have broadened the claimed invention beyond what applicant disclosed the invention to be at the time the application was filed. This broadening does not appear to be supported by the specification as filed, and as such the instant claims comprise new matter.

### ***Claim Rejections - 35 USC § 102***

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

8. Claims 1-9, 12-22, 25, and 26 are rejected under 35 U.S.C. 102(e) as being anticipated by Reff et al. (US Patent 6,011,138).

Reff et al. teach methods of administering monoclonal anti-Fc $\epsilon$ RII (anti-CD23) antibodies that inhibit the binding of IgE to CD23 to humans for the treatment of asthma (see entire document, particularly the abstract, lines 57-60 of column 2, and lines 41-67 of column 38). These antibodies can be formulated into compositions comprising for administration via a variety of routes, with intravenous administration preferred (see lines 21-26 of column 40). Physiological saline solutions are taught for use with parenteral administration (see particularly from line 30 of column 43 to line 14 of column 44).

Therefore, the prior art anticipates the claimed invention.

#### ***Claim Rejections - 35 USC § 103***

9. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

10. Claims 1, 11, 14, and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Reff et al. (US Patent 6,011,138) in view of Cockcroft et al. (J. Allergy Clin. Immunol. 1987, 79:734-740).

The teachings of Reff et al. have been discussed *supra*. These teachings differ from the instant claimed invention in that administration of anti-CD23 antibodies is not

taught in conjunction with other well known anti-asthmatic agents such as corticosteroids and sodium cromoglycate (cromolyn).

Cockcroft et al. teach the administration of well known anti-asthmatic agents, and that administration of multiple anti-asthmatic agents offer an advantage because administration of only a single agent is often inadequate to clinically treat asthma symptoms (see entire document, particularly the abstract and discussion section). It is further taught that corticosteroids are desirable for combination therapy with anti-asthmatic agents since they have the advantageous property of being able to be administered prophylactically (see particularly the last sentence of the abstract and the last paragraph of the discussion on page 739).

Therefore, a person of ordinary skill in the art at the time the invention was made would have been motivated to coadminister anti-CD23 antibodies as taught by Reff et al. and corticosteroids as taught by Cockcroft et al. because administration of any single agent may not be sufficient to control clinical asthma symptoms as taught by Cockcroft et al., with corticosteroids offering the particular advantage that they are an agent known to be effective in treating asthma that can be administered prophylactically.

11. Claims 1-9, 12-22, 25, and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Flores-Romo et al. (Science, 1993, 261:1038-1041) in view of Mosley et al. (US Patent 5,599,905).

Flores-Romo et al. taught that administering polyclonal antibodies that bind human CD23 (i.e. Fc $\epsilon$ RII) inhibits the synthesis of IgE both in vivo and in vitro, and that regulation of IgE synthesis by CD23 is important in allergic diseases (see entire document, particularly the abstract). This inhibition was observed for administered whole antibody as well as administered Fab fragments (see particularly Table 1). The antibodies were present in phosphate-buffered saline and were administered via a parenteral route, specifically intraperitoneal (see note 7 and the legend of Table 1). It is further taught that administration of anti-CD23 causes a reduction in the expression of CD23 on cells (see particularly figure 3 and the first full paragraph of the left column of page 1040). These teachings differ from the instant claimed invention in that Flores-

Romo et al. do not teach that asthma is an allergic disease and in that the antibodies were not administered to a human patient.

Mosley et al teach that agents which suppress production of IgE are to be used in the treatment of human diseases such as allergic rhinitis, bronchial asthma, atopic dermatitis and gastrointestinal food allergy, and that intravenous administration is a preferred route for administering such agents to humans (see entire document, particularly lines 1-43 of column 16).

As such, it would have been *prima facie* obvious to a person of ordinary skill in the art at the time the invention was made to administer the anti-CD23 antibodies of Flores-Romo et al. to humans to treat asthma. Motivation to do so at the time the invention was made comes from the teachings of Mosley et al. that agents which inhibit IgE production are preferentially administered intravenously for treating asthma and the teachings of Flores-Romo et al. that administering anti-CD23 antibodies inhibits IgE production *in vivo*.

Note that dependent claims 6 and 19 recite that anti-Fc $\epsilon$ RII receptor protein antibodies inhibit the binding of IgE to Fc $\epsilon$ RII. Further, any agent that decreases a patient's total IgE level and level of cellular Fc $\epsilon$ RII would necessarily inhibit the binding of IgE to Fc $\epsilon$ RII since the decreased expression levels make it less likely ligand-receptor pairs can be formed.

12. Claims 11 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Flores-Romo et al. (Science, 1993, 261:1038-1041) in view of Mosley et al. (US Patent 5,599,905) as applied to claims 1-7, 9, 12, 13, 14-20, 22, 25, and 26 above, and further in view of Cockcroft et al. (J. Allergy Clin. Immunol. 1987, 79:734-740).

The teachings of Flores-Romo et al. in view of Mosley et al. have been discussed *supra*. These teachings differ from the instant claimed invention in that administration of anti-CD23 antibodies is not taught in conjunction with other well known anti-asthmatic agents such as corticosteroids and sodium cromoglycate (cromolyn).

Cockcroft et al. teach the administration of well known anti-asthmatic agents, and

that administration of multiple anti-asthmatic agents offer an advantage because administration of only a single agent is often inadequate to clinically treat asthma symptoms (see entire document, particularly the abstract and discussion section). It is further taught that corticosteroids are desirable for combination therapy with anti-asthmatic agents since they have the advantageous property of being able to be administered prophylactically (see particularly the last sentence of the abstract and the last paragraph of the discussion on page 739).

Therefore, a person of ordinary skill in the art at the time the invention was made would have been motivated to coadminister anti-CD23 antibodies as taught by Flores-Romo et al. and Mosley et al. and corticosteroids as taught by Cockcroft et al. because administration of any single agent may not be sufficient to control clinical asthma symptoms as taught by Cockcroft et al., with corticosteroids offering the particular advantage that they are an agent known to be effective in treating asthma that can be administered prophylactically.

### ***Double Patenting***

13. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

14. Claims 1-9, 11-22, and 24-26 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-24 of U.S. Patent No. 6,630,140. Although the conflicting claims are not identical, they are not patentably distinct from each other because the patented claims are more narrow in scope and thus anticipate the instant claims.

Specifically, the patented claims recite that administering an agent which inhibits the binding of IgE to Fc $\epsilon$ RII prevents induction of "a CD23 mediated asthmatic state" and that said administration is performed on "airway smooth muscle cells." The instant claims recite methods of preventing induction of an asthmatic state, a broader limitation since all asthmatic states are prevented rather than only ones that are mediated by CD23. Similarly, the agent administered in the instant claims can be administered anywhere rather than only being administered to airway smooth muscle cells as is recited in the patented claims. Thus the patented claims anticipate the instant invention because the patented claims recite a specific set of limitations encompassed by the generic language of the instant claims.

15. No claims are allowable.

16. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael Szperka whose telephone number is 571-272-2934. The examiner can normally be reached on M-F 8:00-4:30.

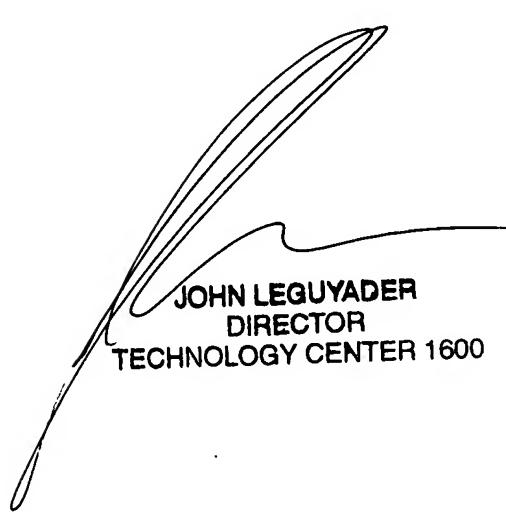

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Christina Chan can be reached on 571-272-0841. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
